Accessed by

# **Valuation**

The pre-money valuation displayed below is the result of the weighted average of different methods. The use of several methods is a best practice in company valuation, as looking at the business from different perspectives results in a more comprehensive and reliable view.

These methods are compliant with IPEV (International Private Equity Valuation) Guidelines and each of them will be explained in more detail in the following pages of the report.

More information on the weights can be found in the Appendix.

# **Qualitative methods**

# Scorecard Method: \$7,469,111

This method was conceived by William H. Payne of Ohio TechAngels group and endorsed by the Ewing Marion Kauffman Foundation. The valuation of the startup depends on how different this is from the assumed average of a set of comparable companies from the same region.

Startups' qualitative traits are divided in 6 criteria, compared with the assumed traits of the average company, and given a score according to whether it over- or under-performs the assumed average company. These scores are multiplied by weights that represent the impact of the criteria on the valuation. The sum of these weighted scores multiplied by the average valuation leads to the company's pre-money valuation.

## Normalized scores of the company for each criteria

100.00 %

66.66 %

91.66 %

-40.00 %

100.00 %

100.00 %

Strength of the team

Strength and protection

Competitive Environment

Strategic relationships with partners

Funding required

## 심하 **Parameters**

Average valuation (United States): \$ 3,918,222

## Weights of the criteria

Strength of the team: 30% Size of the Opportunity: 25% Competitive Environment: 10%

Strategic relationships with partners: 10%

Strength and protection of the product/service: 15%

Funding required: 10%

/// Please see appendix for data sources, defaults, and breakdown of the traits

# Checklist Method: \$ 5,840,889

The creator of the method is Dave Berkus, one of the most prominent Californian angel investors. The valuation of the startup consists of intangible building blocks that sum up to the assumed maximum pre-money valuation.

The maximum pre-money valuation is split in 5 criteria according to their weight. The startup obtains portions of these maximum criteria valuations according to how close its qualitative traits are to the most desirable ones. Their sum is the startup pre-money valuation.

## ¦਼ੀ Parameters

Maximum valuation (United States): \$8,000,000

## Criteria maximum valuations

Quality of the core team: \$ 2,400,000 (30%)

Quality of the Idea: \$ 1,600,000 (20%)

Product roll-out and IP protection: \$ 1,200,000 (15%)

Strategic Relationships: \$ 1,200,000 (15%)

Operating Stage: \$ 1,600,000 (20%)

/// Please see appendix for data sources, defaults, and breakdown of the traits

# Qualitative traits summary

Below a summary of the traits at the basis of the scores for the two qualitative methods. Please see appendix for detailed breakdown of which trait is used in which method.

## **Team**

## Founders

Time commitment: Full time Average age: More than 45

Founded other companies before: Yes

more than 5 years
rears of experience in the industry: 40
Business and managerial background: Top-tier management
experience
Technical skills: All technical skills inhouse

## Network

Board of advisors: Yes Legal consultants: Yes Current shareholders: Crowdfunding

## **Market**

Total Addressable Market (TAM): \$50,000,000,000 Annual growth rate of the market: 15.00 %

Demand validated: Yes

Internationalization: Active globally

## **Product**

Product roll-out: Already to Market

Feedback received: All positive

Loyalty to the product/service: High retention

Partners: Contracts with key strategic partners signed and serving high volumes

## Competition

Level of competition: Dominated by several players

Competitive products are: Good

Differentiation from current solutions: We innovate in terms of

International competition: Established

## **Protection**

Barriers to entry of the market: Modest

Applicable IP: Patent

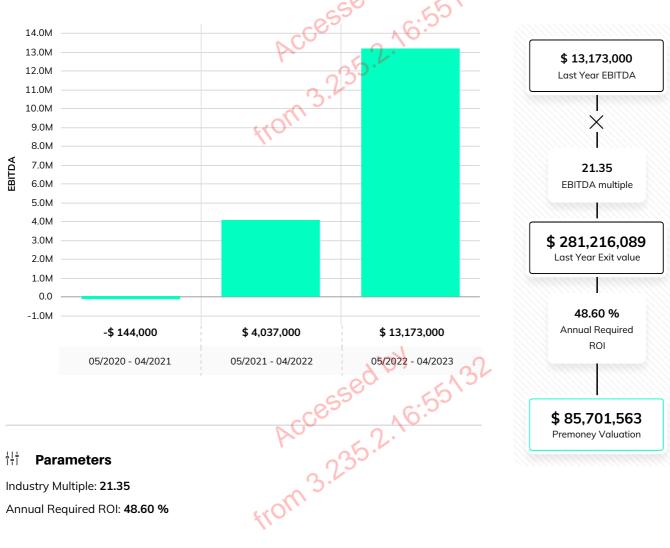

Current IP protection: IP protection secured at regional level

## VC Method

# Premoney Valuation: \$85,701,563

The VC (Venture Capital) method is one of most common approaches among financial practitioners in the private company market. The startup is given the valuation that will grant investors a predetermined return at the exit.

The potential exit value of the company is computed with an industry-based EBITDA multiple. The valuation is equal to this value discounted by a required ROI (Return On Investment). This depends on the startup's stage of development, higher for early stage riskier companies, lower for more mature ones. It is the minimum rate that will allow investors to have positive returns from portfolios where most companies fail and gains come from a selected few.

## 片 **Parameters**

Industry Multiple: 21.35

Annual Required ROI: 48.60 %

/// Please see appendix for data sources and defaults

# **DCF Methods**

The DCF (Discounted Cash Flow) methods represent the most renown approach to company valuation, recommended by academics and a daily tool for financial analysts. The valuation is the present value of all the free cash flows to equity the startup is going to generate in the future, discounted by its risk.

These methods weight the projected free cash flow to equity by the probability the startup will survive. Then, the flows are discounted to present by a rate that represents risks related to industry, size, development stage and profitability. Lastly, an illiquidity discount is applied to the sum of the discounted cash flows to compute the valuation.

The value of cash flows beyond the projected ones is represented by the TV (Terminal Value) and the way it is calculated is the difference between the following two methods.

# DCF with LTG: \$39,944,981

The DCF with LTG (Long Term Growth) assumes the cash flows beyond the projected ones will grow forever at a constant rate based on the industry and computes the TV accordingly.

ៅ Parameters

Long term growth: 2.50 % Illiquidity discount: 23.21 %

Discount rate
Risk free rate: 1.82 %

Survival rates
Year 1: 94.33 %

Beta: **2.00** 

Year 2: **89.53 %** 

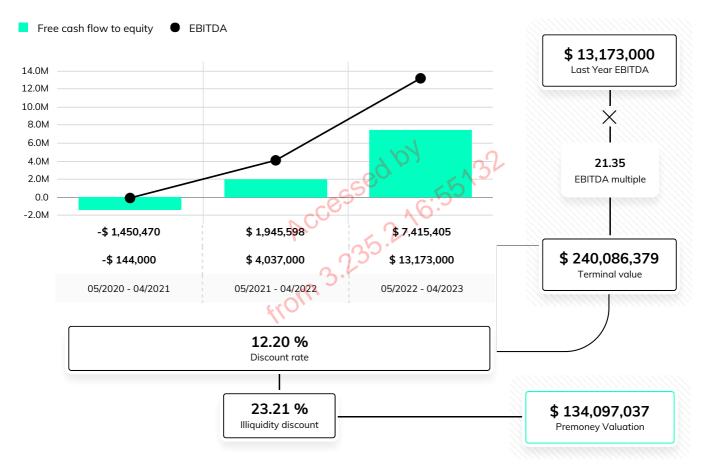

Market Risk Premium: 5.20 %

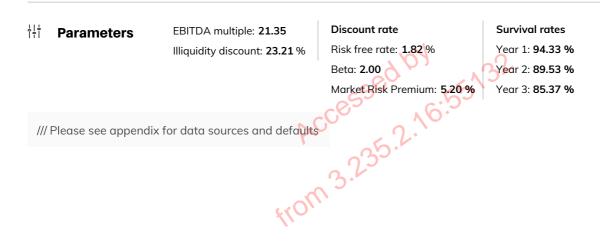

Year 3: 85.37 %

/// Please see appendix for data sources and defaults

# DCF with Multiples: \$ 134,097,037

The DCF with Multiple assumes the TV (Terminal Value) is equal to the exit value of the company computed with an industry-based EBITDA multiple.

# **Financial Projections**

# **Profit & Loss**

The profit & loss projections are displayed below. Data about revenues and operating costs are provided by the company. Depreciation and amortization, interest, and taxes are either provided by the company or estimated by Equidam. Please consult our methodology document for more details.

Med-X, Inc. stage of development: Expansion stage

These are determined according to the following principles:

- Qualitative information is more important in early stage companies, where performance uncertainty is extremely high, so qualitative methods are weighted in more
- The investors' view is equally important across all stages, so the weight of the VC method does not change
- Quantitative information is more reliable in later stages, when a company already has a proven financial track record. Therefore, it is possible to use the DCF methods more extensively as projected results get founded in past performance

## VC method

Below the sources of the valuation parameters used in the VC Method: EBITDA Multiple and Annual Required ROI, and their default values provided by Equidam

## **EBITDA** multiple

Description: Enterprise value on EBITDA multiples computed over a dataset of global, publicly listed firms organized by

industry

Datasource: Prof. A. Damodaran, NYU Stern School of Busines

Update: Annual

Notes: We favor the use of EBITDA multiple, as we believe revenue multiples fail to capture the ability of startups to

generate cash flow, i.e. the ultimate determinant of value.

Med-X, Inc. industry: Other Personal Products

Other Personal Products EBITDA multiple: 21.35

## **Annual Required ROI**

The default annual required ROI rates are determined by Equidam based on the returns investors require for companies at different stage of development, and are shown below. They can be manually adjusted by the company.

Med-X, Inc. stage of development: Expansion stage

Accessed by Accessed by Accessed by From 3.235.2.16:55132

Med-X, Inc. Valuation Report **Appendix** 

## **DCF Methods**

Below the sources of the valuation parameters used in the DCF Methods: Discount Rate, Survival Rates and Illiquidity Discounts, and their default values provided by Equidam.

## Discount rate

## Risk Free Rate

Description: 10Y government rates

Datasource: Trading Economics (tradingeconomics.com), various public databases

nons are more vo Update: Bi-annual (but more frequent if macroeconomic conditions are more volatile)

Notes: For the Eurozone we apply the German 10Y Bond rate

Med-X, Inc. country: United States United States risk free rate: 1.82%

## Industry betas

Description: Industry beta computed over industry specific portfolios of global, public listed companies (same as in EBITDA

multiple)

Datasource: Prof. A. Damodaran, NYU Stern School of Business

Update: Annual

Med-X, Inc. industry: Other Personal Products

Other Personal Products default beta: 2.00

## Market Risk Premium

...us 12 t.
...usiness
...us 12 t.
...usiness
United States
United States default market risk premium: 5.20% Description: Country based total equity risk premium as implied in the previous 12 trailing months.

Datasource: Prof. A. Damodaran, NYU Stern School of Business

Update:

## **Survival Rate**

Dataset: Country-level survival probabilities of the latest cohort of companies with three years of data available.

Datasource: European Office of Statistics (http://ec.europa.eu/eurostat), U.S. Bureau of Labor Statistics (https://www.bls.gov/),

specific academic research and public offices of statistics for different countries.

Update: Annual

Med-X, Inc. year of incorporation: 2014

Default survival rate Year 1: 94.33%

Default survival rate Year 2: 89.53%

Default survival rate Year 3:85.37%

Default survival rate Year 4:81.71%

Default survival rate Year 5: 78.43%

## Illiquidity discount

Accessed by Access The default illiquidity discount is assigned based on current profitability and projected revenues, according to the approach suggested by William L. Silber.

Med-X, Inc. illiquidity discount: 23.21%

Accessed by Accessed by Accessed by From 3.235.2.16:55132

# DCF with LTG

## Long term growth

Dataset: Global, publicly listed companies organized by industry (same as in EBITDA multiple)

Datasource: Prof. A. Damodaran, NYU Stern School of Business

Update:

Notes: The value is winsorized over a 0% - 2.5% range. We do not want the long term growth to be above world GDP

growth expectations, as it would mean the company is going to overgrow world economy at some point in time

# DCF with Multiples 5.7.16.155137 EBITDA multiple

Dataset: Global, publicly listed companies organized by industry

Datasource: Prof. A. Damodaran, NYU Stern School of Business

Update: Annual

Notes: We favor the use of EBITDA multiple, as we believe revenue multiples fail to capture the ability of startups to

generate cash flow, the ultimate determinant of value.

Med-X, Inc. industry: Other Personal Products

Other Personal Products default EBITDA multiple: 21.35

Accessed by Accessed by Accessed by From 3.235.2.16:55132
